

Overview

The Triatek® Universal Valve Module (UVM) is used to control Venturi Valves through Metasys®. Universal Valve Modules come factory-mounted and wired, and are ideal for retrofits or new installations.

This highly adaptable and interchangeable valve module accepts any 0 - 10 VDC signal and converts it to cfm, making it compatible with virtually all third-party controllers on the market. Sum multiple valves of the same type, for example, Fume Hoods through a communications channel between UVMs. This reduces the requirement for multiple analog inputs (AIs) to one AI with multiple Fume Hoods.

Order the Universal Valve Module with any Triatek Venturi Valve. The following pages include the Universal Valve Module wiring diagram and a typical lab system diagram utilizing a Universal Valve Module.
